

Opendiem Enterprise Level Connectivity – Peer-to-Peer

Now connect multiple **Opendiem™** projects on a single enterprise level server. Connect satellite offices, remote buildings, and franchise locations to your central office via the Internet for a comprehensive view of your corporate portfolio from a simple web browser. Monitor, control, share, and manage resources globally.

Opendiem's Peer-to-Peer console provides a complete view of the status of all Opendiem Servers in the Enterprise including on-line / offline status, software versions of all Opendiem servers and services. The Peer-to-Peer audit log records all activity at the Enterprise level providing a trace of operations.

Opendiem servers can exchange data in real-time. Enterprise-wide automation leads to better plant and building efficiency, reduced energy bills, better comfort for occupants and ready access to Key Performance Indicators (KPI's).

Multiple logical Opendiem domains can be defined and used to logically separate multiple Opendiem server networks. Domain level operations such as updates and Alarm management provide powerful features for managing and filtering data on multiple Opendiem networks.
